US Citizen in Raleigh, North Carolina

EDUCATION

- B.S. Computer Science from Southern New Hampshire University — Status - Graduated

EXPERIENCE

Senior Software Engineer at FUJIFILM Healthcare Americas Corporation — *Mar. 2025 - Present*

- Developed a centralized monitoring platform on Kubernetes using OpenTelemetry, Loki, Tempo, and Prometheus to make application logs, metrics, and traces easier to access and troubleshoot.
- Delivered a full-stack third-party application integration using C#, .NET, and TypeScript, including deployment scripts and backups, to support a major customer sales opportunity.
- Built and integrated a shared dialog UI library using TypeScript, JavaScript, HTML, and CSS across 5+ web applications and a C++ desktop client, standardizing dialog behavior across teams.
- Redesigned a SignalR-based enterprise chat application to prevent duplicate conversations and improve the user experience.
- Optimized SQL queries by improving filtering, sorting, and data retrieval, reducing response times from 6 seconds to near-instant under high load.
- Diagnosed and fixed a long-standing JavaScript memory leak caused by Chrome extension interactions, resolving a customer-impacting production issue.

Software Engineer II at LexisNexis — *May 2023 - Mar. 2025*

- Migrated backend functionality from legacy Java services to C#/.NET, modernizing application components while preserving existing behavior.
- Designed and built a C#/.NET OData authentication flow, allowing JWT-authenticated users to create and use API keys for Power BI access to on-premises reporting data.
- Troubleshot production issues in Azure using Application Insights to analyze logs, investigate failures, and identify root causes.
- Led offshore engineers implementing OData endpoints, assigning work around repeatable application patterns and establishing implementation conventions.

Software Engineer I at LexisNexis — *Feb. 2022 - May 2023*

- Modified Java application configurations and integration behavior to support cloud deployments.
- Implemented custom C#/.NET CORS and host-filtering middleware to secure applications in load-balanced cloud environments.
- Built a GraphQL telemetry framework using schema-level annotations to log request properties in the cloud, with configurable PII obfuscation to improve post-deployment troubleshooting.

Systems Engineer at Infosys (Client: Walmart) *Nov. 2021 - Feb. 2022*

- Fixed bugs across enterprise applications using Java, Spring Boot, Kubernetes, and PL/SQL.
- Applied object-oriented design patterns and established application conventions while implementing Spring Boot services.

PROJECTS

Yavria — AI Context & Knowledge Platform

C#, .NET 10, PostgreSQL, pgvector, RAG, React/TypeScript, Docker, OpenAI

- Built and deployed a multi-service AI platform using .NET, React, PostgreSQL, and OpenAI, supporting semantic search, RAG, and persistent conversation context.
- Designed and deployed a containerized architecture with authentication, API routing, database migrations, and application diagnostics.

NextProblem — Adaptive Coding Interview Practice Platform

C#, .NET 10, ASP.NET Core, React/TypeScript, OpenAI

- Built a full-stack coding-practice platform that tracks problem history and generates personalized daily practice queues based on mastery, completion state, and spaced repetition.
- Designed a focus-first planning system that concentrates practice on individual problem-solving patterns while periodically resurfacing previously learned material.
- Integrated Yavria as an external AI coaching service, supplying practice history and progress as context for personalized guidance while keeping the two systems independently deployable.
